

Lake Whatcom Homeowner Incentive Program

MATERIAL SUPPLIER DIRECTORY

Version 2.2 – September 2020

HIP-Approved Material Suppliers

All HIP projects are designed and constructed based on a set of pre-approved standard details and material specifications, modified as needed to fit the site-specific conditions. HIP Standard Details, Best Management Practices (BMP) Design Standards, and the most current version of the HIP Specifications Book are all available for download on the HIP website at:

www.LakeWhatcomHIP.org/resources.

In order to make it easy to locate and purchase the materials necessary to match the HIP Standard Details and Specifications, HIP provides a list of local suppliers who have indicated that they carry, or can procure, the materials. This is not an exhaustive list, nor does it cover all possible materials that could be HIP-eligible, but it gives homeowners and their contractors a place to start their search.

Material Supplier Directory

The Supplier Directory table lists local businesses who responded to a letter sent to local suppliers who might carry HIP materials. The businesses are organized by the type of materials they supply, and in some cases businesses will be found in multiple locations in the directory. This should be considered a document that will grow along with the program, as more suppliers are made aware of the need for these materials and begin stocking them for sale. HIP strongly encourages contractors (and designers) to develop professional relationships with the suppliers who provide the types of materials most common to completing these projects. These relationships will make it easier to bid projects and secure specialty materials quickly and efficiently. Suppliers not on this list can be added at any time, by reaching out to the contacts listed in the last section of this directory.

Approved Mulch List

In order to make sure that locally-available mulch will meet the specifications required for reimbursement through HIP, the City of Bellingham has tested applicable materials for their phosphorus content. Laboratory testing helps to determine which materials are more likely to leach nutrients into stormwater, where they can run off during a rain storm. The materials which pass the laboratory test are then added to an approved mulch list for use by HIP participants and others completing landscaping projects in phosphorus-sensitive watersheds. The most current version of the approved list, published May 1, 2018 is found in this section, after the Supplier Directory. All materials on this list should be considered equivalent, even if the numbers in the phosphorus-content column differ.
